

Dates-20/8/20 Task-3

## Importing and creating Python modules and packages in python program

Aim:- TO implement and demonstrate the process of importing built-in modules, creating user-defined modules, and organizing code into packages in python, thereby promoting code reusability, modularity, and maintainability.

- 3:-
- 1) Perform common math and random operations
  - 2) Work with the operating system (create/change directions, list contents) and read the python version.
  - 3) Compute basic statistics (mean, median, mode, standard deviation).

### Algorithm:-

- 1) Import required modules: math, random, os, sys, statistics, pathlib.
- 2) math & random:
  - compute sqrt(5), random(30), a random float in [0.0, 1.0], a random integer in [2, 6] (inclusive), pi, ceil(2.3), floor(2.3), factorial(5), gcd(5, 15), abs(-10), power(3, 5), log base 3 of 2, log 10(a) for a=100, and check NaN/Infini
- 3) OS & sys:
  - ⇒ create c:\pythonlab if not present and point the current working directory.
  - ⇒ create c:\Pythonslots24 if not present and change the current working directory to it.

⇒ List all files / directories in the new current directory.

⇒ Print Python interpreter version.

4) statistics:

→ On lists: [5, 6, 8, 10] and [2, 5, 3, 2, 8, 3, 9, 4, 2, 5, 6], compute mean, median, mode, stdev.

5) Print neatly formatted results.

Program:-

```
import math
import random
import os
import sys
import statistics as stats
from pathlib import Path

print("m - MATH & RANDOM -")
print("sqrt(5) =", math.sqrt(5))
print("radians(30) =", math.radians(30))

print("random() in [0,1) =", random.random())
print("random(2,6) =", random.randint(2,6))

# inclusive
print("pi =", math.pi)
print("ceil(2.3) =", math.ceil(2.3))
print("f1000(2.3) =", math.f1000(2.3))

print("factorial(5) =", math.factorial(5))
print("gcd(5,15) =", math.gcd(5,15))
print("abs(-10) =", abs(-10))
```

## Expected sample output:-

### MATH & RANDOM

$\sqrt{5} = 2.23606797749979$  radians(30) =

$0.5235987755982988$  random() in  $[0,1]$  =

$0.3744887175646646$  ← will vary randint(0,1)

← inclusive; will vary

$\pi = 3.141592653589793$  ceil(2.3) = 3

$factorial(5) = 120$  gcd(5,15) = 5

$abs(-10) = 10$  pow(3,5) = 243 log base 3 of 2 =

$0.6309297535714574$

$\log 10(100) = 2.0$  isnan( $\infty$ ) = True,

isnan(NaN) = True

### OS & sys

created / ensured : C:\Python\lab

current working directory : C:\ - (your current path)

located / ensured & changed into : C:\Python\slot  
Directory contents of C:\Python\slot

Python version : 3.x.x (details..)

STATISTICS - mean([5,6,8,10]) = 7.25

Point("Python version:", sys.version)

Point("In - STATISTICS -- ") data1 =  
[5, 6, 8, 10]

data2 = [2, 5, 3, 2, 8, 3, 9, 4, 2, 5, 6] Point(f"mean  
{data1} =", stats.mean(data1)) Point  
(f"median({data1}) =", stats.

median(data1)) Point(f"mode({data1}) =",

stats.mode(data2))

print(f"stdev({% data2}) = ", stats.stdev(data2)).

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Output for the above code is as follows:

mode of the data is 100.0  
standard deviation of the data is 100.0

Result:- Thus, the python program implement and modules packages are executed sequentially.

output :-

RESTART:

3.2 Aim :- Create a Python package named cardpack containing a module cardfun that imports the random module. Assign of cards, call a function from the module, and display a random sample of cards.

Algorithm :-

- Step 1 :- Start
- Step 2 :- To create a package cardpack
- Step 3 :- To create a module cardfun and import random function.
- Step 4 :- Assign a card range.
- Step 5 :- Call a module function.
- Step 6 :- Display the random sample cards
- Step 7 :- Stop.

Program :-

```
cardfun import  
random def func():  
cards = [] for i in  
range(1, 53):  
    cards.append(i) shuffled_cards = random.sample  
(cards, k=52)
```

print("In\n", shuffled\_cards, "\nIn")

mymod.py

```
import cardfun  
cardfun.func()
```

Result :- Thus, the python program i.e. package and Card pack module is executed successfully.

33

Aim:- you are tasked with developing a modular calculator application in python. The calculator should support basic arithmetic operations: addition, subtraction, multiplication, and division. Each operation should be implemented in a separate module. Additionally, you should create a main program to handle user input, call the appropriate module, and display the results.

Algorithm:

1. Define functions for addition, subtraction, multiplication and division.
2. Handle division by zero by raising an error if the divisor is zero.
3. Import the module containing these functions.
4. Initialize two numbers ( $a=10, b=5$ ).
5. call each function using `.mymath.<function-name>(a,b)`.
6. Print the results of all operations.

Program

(my)math

```
def add(a,b): return  
    a+b def subtract(a,b):  
    return a-b def
```

output:-

Addition :- 15

Subtraction : 5

Multiplication : 50

Division : 2.0

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

Ans. 15 + 5 = 20  
15 - 5 = 10  
15 \* 5 = 75  
15 / 5 = 3

multiply(a,b):

```
return a*b def divide(a,b): if b==0;  
raise ValueError("cannot divide by zero")  
return a/b
```

```
import mymath a=10 b=5
```

```
print("Addition:", mymath.add(a,b))
```

```
print("subtraction:", mymath.subtract(a,b))
```

```
print("multiplication:", mymath.multiply(a,b))
```

```
print("division:", mymath.divide(a,b))
```

Q

✓

Result:- Thus, the Python program is  
arithmetic operators are execute  
successfully

3.4

Aim:- You are working on a python project that requires you to perform various mathematical operations and geometric area calculations. To organize your code better, you decide to create a package named mypackage which includes sub packages pack1 and pack2 with two modules mathfunctions and areafunctions. Demonstrate the use of the functions by performing a few calculations and printing the results.

Algorithm:-

1. Create mathfunction.py module:
2. Create areafunction.py module:
3. Create main.py:
4. Print the output as expected.

Program:-

1. Create the mathfunction.py module

```
def add(a,b):
```

```
    return a+b
```

```
def multiply(a,b):
```

```
    return a*b
```

```
def divide(a,b):
```

If  
b==0: return "Error! Division by zero."

```
return a/b
```

2. Create the areafunctions.py module

```
import math
```

```
def circle_area(radius):
```

Output :-

Addition : 15

Subtraction : 5

Multiplication : 50

Division : 2.0

Circle Area (radius=7) : 153.93804002589985

Rectangle Area (5x10) = 50

Triangle Area (base=6, height=8) : 24.0

```
return math.pi * radius * radius def
```

```
rectangle_area(length, width):
```

```
return length * width def
```

```
triangle_area(base, height):
```

```
return 0.5 * base * height
```

3. Create the main.py file

```
import mathfunctions
```

```
import areafunctions
```

```
# Using math functions
```

```
print("Addition:", mathfunctions.add(10, 5)) print
```

```
("Subtraction:", mathfunctions.subtract(10, 5))
```

```
print("Multiplication:", mathfunctions.multiply  
(10, 5))
```

```
print("Division:", mathfunctions.divide(10, 5))
```

```
# Using area functions.
```

```
print("Circle Area (radius=7):", areafunctions.cir  
-area(7))
```

```
print("Rectangle Area (5x10):", areafunctions  
rectangle-area(5, 10))
```

```
print("Triangle Area (base=6, height=8):", area  
functions.triangle-area(6, 8))
```
